 Salt Lake City

Profile

Data Engineer with 6+ years of experience in building data intensive applications, tackling challenging architectural and scalability problems, collecting and sorting data. Currently working as enterprise data warehouse engineer to designed, develop, and maintain a scalable BI platform that powers data-intensive analytical applications.

- Developed data-driven solutions and data infrastructure that can ingest and transform data at scale coming from many different sources, different customers, and in many different varieties to meet evolving business needs.
- Experienced in migrating entire BI applications from on-prem to cloud applications.
- Created robust batch data pipelines for Operational Data Stores, Data Warehouses and Data Marts that satisfy all functional and technical requirements.
- Built, improved streaming data pipelines in cloud environments.
- Experienced in a database administration role in OLAP and OLTP systems.
- Built reports and dashboards for various business users in Looker based on their requirements.
- Designed APIs and developed functionality by collaborating with Front-End Developers to integrate user-facing elements with server-side logic and optimized backend components to improve responsiveness and overall performance of various applications.
- Automating actions of users within ERP systems to execute business processes.
- Experienced on AWS services IAM, DynamoDB, S3, Redshift, Lambda, Glue, SNS, Athena, API Gateway, Athena, Cloud Watch, X-Ray, WAF and have good knowledge in other AWS services.
- Worked on python packages NUMPY, PANDAS, MATPLOTLIB for data analysis and visualization.
- Extensively worked on AWS Boto3 software development kit.
- Experienced in Python, data structures and algorithms.
- Strong analytical, troubleshooting and communication skills.

Technical Skills

Programming Languages	Python, PostgreSQL, LookML, T-SQL, PartiQL, Open API, PySpark.
AWS Services	IAM, DynamoDB, S3, Redshift, Aurora, Lambda, Step Functions, Glacier, Glue, SNS, API Gateway, Athena, Cloud Watch, X-Ray, WAF, EC2 and VPC.
Databases	IBM DB2, MS SQL Server, AWS RDS, DynamoDB, Redshift.
Other Applications	Talend, HVR, Fivetran, SAP Data Services, Matillion, Looker, Boomi.

Education

- University of Illinois, Master's in Management Information Systems
- JNTU-Hyderabad, Bachelor's of Technology in Electronics and Communication Engineering

EXPERIENC

Nicholas and Company, Salt Lake City, Utah

Nov 2022 - Present

Principal Data Engineer

- Collaborated with stakeholders from various services of the organization throughout the requirements gathering, technical design and development lifecycle phases to design data models and dashboards for business and customer needs.
- Developed and maintained a scalable BI platform that powers data intensive analytical applications.
- Understand and manage the data needs of stakeholders across various teams in the organization
- Lead the design & implementation of scalable & fault tolerant data applications on Big-Data & Cloud Platforms to store & process data from upstream sources with high availability
- Contribute to high impact problems/projects through in-depth evaluation of complex business processes, system processes, enterprise standards & procedures
- Enforce data management standards and procedures
- Partner with multiple teams to ensure appropriate data solutions to meet goals as well as identify and define necessary system and process enhancements
- Provide technical leadership for data engineering agile teams to deliver against sprint and program increment objectives
- Work closely with Product Owners, Product Managers, Program Manager, Scrum Masters, and Team Members in a Scaled Agile framework
- Stay up to date on latest trends in data engineering and recommended best practices
- Develop innovative frameworks to avoid redundancy by promoting automation
- Leads the design and building of data solutions and applications that enable reporting, analytics, data science, and data management
- Provides guidance to others to support the building of complex technical capabilities
- Researches and leads the identification and implementation of process improvements that address complex technology gaps
- Perform other duties and/or special projects as assigned

Nicholas and Company, Salt Lake City, Utah

Feb 2019 - Oct 2022

Data Warehouse Engineer

- Collaborated with stakeholders from various services of the organization throughout the requirements gathering, technical design and development lifecycle phases to design data models and dashboards for business and customer needs.
- Developed and maintained a scalable BI platform that powers data intensive analytical applications.
- Built the data lake / central repository of the data in S3, where the source system data is stored in raw copies or unstructured format.
- Captured data changes in highly transaction tables of OLTP systems near real-time using HVR and integrate the data lake and data warehouse.
- Built and maintained reliable data pipelines in Matillion that process the data captured in OLTP systems and load into OLAP system (Redshift).
- Drastically reduced ETL runtimes and CPU loads with the help of real time log-based CDC and incremental loads.
- Optimizing/tuning schema objects to process the data quickly and accurately in and out of the data warehouse and fine-tuned Stored Procedures, Indexes, Views and Triggers in SQL Server.
- Setup workload management (WLM) to manage priorities within workloads so that short, fast-running queries will not get stuck in queues behind long-running queries in Redshift.
- Periodically performed maintenance tasks on EDW (Redshift) by performing Vacuuming, Column Compression Encoding, and creating Zone Maps to avoid unnecessary I/O and storage requirements.
- Built serverless REST API services using API Gateway and extended them to server-side by building Lambdas that can perform CRUD operations.
- Built AWS Lambda to automate actions of user within ERP systems to execute business processes.

- Created a cost-effective BI Platform using AWS services S3-GLUE[Spark]-Athena, that is used as a testing and development platform instead of Redshift.
- Creating reports/dashboards for end users, which communicate insights from data through visual representation and helping them to plan and make strategic decisions.
- Enforcing data quality and consistency standards using Talend to identify inconsistencies in the source systems.
- Used Amazon CloudWatch and X-Ray for performance monitoring of AWS applications.

Data-Lake Solutions, New Albany, Ohio

April 2018 – Jan 2019

Data Engineer

- Responsible for designing and planning for solutions in the various engineering subject areas as it relates to data storage and movement.
- Ensuring completeness and compatibility of the technical infrastructure to support system performance, availability, and architecture requirements.
- Created event-driven Lambda functions to invoke and drive the various application flows in AWS.
- Backend development of web application using serverless architecture (API-Lambda-DynamoDB).
- Set up an integrated response to the API Gateway requests from DynamoDB to client using Lambda functions to perform CRUD and cross functionality operations.
- Built data lake in S3 and created processes for data archiving and long-term backups in Glacier.
- Built interactive querying application using S3, Glue and Amazon Athena with which end users can analyze/query data in S3(file format) rather than using traditional RDBMS.
- Built PySpark applications in AWS Glue to perform ETL.
- Worked with system engineers to setup AMI/Snapshots/Volumes and managed resources for various systems.
- Created SNS tasks for high-throughput messaging and performance metrics alerts.
- Monitored applications, optimized resource utilization and improved performance using AWS Cloud Watch.
